

Your patients count!

Scan to explore the data on the **Community Counts Data Visualization Tool**

Thank you for participating in the Community Counts Registry. We've **learned so much** about bleeding disorders in **women and girls*** from you and your patients. **Your patients and your data count!**

*Community Counts data are recorded by sex assigned at birth and information presented here includes all people who have shared biological risk factors for bleeding disorders due to birth sex

7,072 Registry participants (28%) are **women and girls**

Women and girls can present **differently** for a bleeding disorder diagnosis than men and boys.

52% of **women and girls** received treatment for a first bleed at **ages 6-19 years old**, compared to **21%** of **men and boys in this age group****.

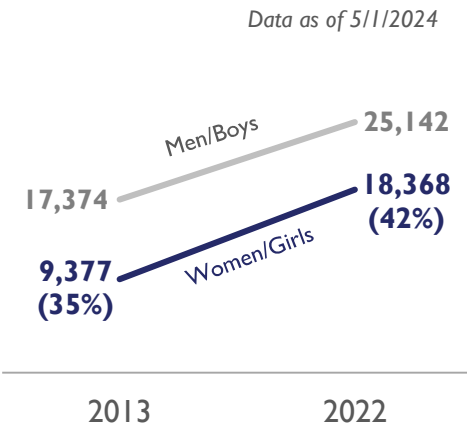

**among patients with a documented age at first bleeding treatment

65% of **women and girls** in the Registry have **Von Willebrand Disease**, compared to only 12% of men and boys.

Over 10 years, the number of **female patients** seen by hemophilia treatment centers[^] **nearly doubled** and the percentage of female patients **increased from 35% to 42%**. Having more women and girls in the Registry will improve our understanding of bleeding disorders in this population.

Data as of 5/1/2024

Help us spread the message!

The National Bleeding Disorder Foundation's **"Better You Know"** program was developed to raise awareness of bleeding disorders among women and girls who may experience bleeding symptoms but have not yet been diagnosed and to increase awareness among non-hematology healthcare providers.

Help us get the word out - women and girls have bleeding disorders and, for some women, heavy periods can be an important clue for earlier diagnosis and better care.
